eHealth and Serious Games

Our group uses well-being technology and gaming applications, systems and processes to provide human-centric services that support and maintain people's quality of life, well-being, health and functional capacity.

In addition to personal well-being, we also develop patient monitoring and IT systems and develop games.

Our research and development projects are grouped under the following themes:

- product development for well-being and game technology;
- information management;
- development of services associated with health and well-being.
